
Rescue

Explanations

The engineer moves east to room (2, 0) because room (2, 1) contains rubble. There is no direct path to room (2, 1) from the engineer's current location, as no adjacent room contains rubble. The engineer is likely planning to move to room (2, 0) in order to then move south to room (2, 1), where it can begin to remove the rubble. This is suggestible as the features show that the engineer **seems to prioritize moving toward areas containing rubble**.

Next-Action Prediction

Based on the new features, the engineer will likely move south to room (2, 1) because this room contains rubble, and **the engineer's goal is to remove rubble**.

Search

Explanations

The engineer moves east to room (2, 0) because this action aligns with an exploration goal. The current room (1, 0) has already been explored, and room (3, 0) to the right has not been explored. Therefore, **the engineer seems to move east to reach the unexplored room (3, 0)**.

Next-Action Prediction

Based on the new features, the engineer will likely move east to room (3, 0). This is because room (3, 0) has not been explored yet, and **the engineer seems to be following a strategy of exploring unexplored rooms**. Moving east to room (3, 0) aligns with this strategy.
